

Stage I: Assigning a case-control status for primary hypercholesterolemia in the general population.

LLT=lipid-lowering treatment, LDL-C=low-density lipoprotein cholesterol, TG=triglycerides

Stage II: Use a scoring system to weigh each component of the algorithm to ascertain FH case status in individuals with hypercholesterolemia. Per diagnostic group choose the highest applicable score. Provide a final score by summing up each individual score per each group.
